

Step 1 - Lace lift loops in star fashion to provide easy handling of wire frame once fabric sides and bottom are removed

Step 2 - Use wire cutters to cut top horizontal wire both left and right of each nursery container lift loop.

Since fabric sides are only attached between lift loops, Fanntum fabric is now free to be cut and removed.

Step 3 - Vertically slit and pull down side fabric from top horizontal wire close to bottom horizontal wire.

Fanntum's top horizontal wire easily pulls down with planter fabric, leaving lift loops intact and laced for easy moving of plant container.

Step 4 - Lift plant away from fabric and place in planting hole with wire basket intact.

For machine lifting, attach chain hook where star lacing crosses.

Step 5 - Remove star lacing and bend lift loops down inside planting hole.

Resulting top 4-5 inches of unobstructed side surface allows stabilization root growth to grow uninhibited into surrounding soil.

For both easy planting and an environmentally friendly planting system, Fanntum's unique wire basket naturally decomposes in soil.
